

The Overpopulated British Empire Meets the New Ice Age

by Mohd Peter Davis

Mr. Davis is an honorary visiting scientist at the Institute of Advanced Technology, Universiti Putra Malaysia, near Kuala Lumpur.

Feb. 10—The Greenview Column in the British *Economist* Feb. 13, 2010 makes the silly, and rather desperate claim, that wildlife flourishes only when man is excluded from the environment, as in no-man's lands such as Chernobyl, and old war zones such as between North and South Korea.

“It is depopulation that matters. Armed conflict and its knock-on effects simply happen to be one of the few forces on the planet that can cause quick and thorough depopulation. . . . The nasty truth is that the likelihood of random and violent death is the cheapest form of conservation yet invented.”

Good! Now the gloves are off. The *Economist* is lining up behind the outrageous call by genocidalist Prince Philip, in the September 2009 issue of the U.K. *Shooting Times* magazine, to cull the British population by 95%.

“There are now 60 million people living in this country and we are about the same land size as New Zealand—this country had three million people in Queen Elizabeth First's day back in the 16th century.

“People go on about this carbon footprint, but they fail to realise that the amount of carbon going into the atmosphere is entirely dependent on the number of people living on the earth.”

This is all part of Prince Philip's Malthusian insistence, on behalf of the British Empire, and repeated virtually every time he opens his mouth: that the Earth is overpopulated. During the 2008 food riots in many countries he declared: “It's really that demand is too great—too many people.” Twenty years earlier, he issued his own tombstone statement reported by Deutsche Press Agentur (August 1988): “In the event that I am reincarnated I would like to return as a deadly

virus, in order to contribute something to solve overpopulation.”

Prince Philip, dubbed “the Royal Virus,” has never retracted this satanic statement, even with worldwide fears of a reemergence of an 1918-type influenza virus pandemic that killed 50 to 100 million, when the world population was one quarter compared to today. Why should he? He played the leading role with the card-carrying Nazi, Prince Bernhard of the Netherlands, in setting up the Environmentalist movements, the World Wildlife Fund for Nature, and Greenpeace, that merely renamed and whitewashed the British Empire's centuries-old Eugenics movement after it was adopted by Hitler to exterminate “useless eaters,” political opponents, and Jewish people.

Under the new guise of saving the world's wildlife, the unrelenting propaganda by the green environmental movements, since the 1960s, successfully banned the mosquito repellent DDT, “the most life-saving chemical ever invented by man,” on the fraudulent claims that it was harmful to wildlife. This coincided with a similar anti-nuclear fraud claiming any level of radiation was harmful to man, and led intentionally to the collapse of the Atoms for Peace program that was making good progress in addressing hunger and poverty in developing countries.

Now that a growing number of scientific experts have discredited so-called catastrophic man-made global warming, as yet another fraud by the green environmentalists, the *Economist* is coming to the rescue, by replacing this used-up lie with a fresher lie, that wildlife conservation cannot coexist with mankind.

A Noah's Ark in the Deep Tropics

Exposing this new lie is the concept of Wildlife Technology, being developed in Malaysia, permanent home to perhaps half of the world's estimated 50 million species on Earth. The strip of equatorial rainforests

of Malaysia and Indonesia, West Africa, and the Amazon—the “Deep Tropics”—plays an essential Noah’s Ark function in preserving the Earth’s diversity of species during the 100,000-year-long ice ages that regularly exterminate the bulk of living matter under kilometers-thick sheets of ice. The glaciers spread from the North and South Poles to the edge of the Tropics, burying land-based living matter, and further mass extermination occurs in the tropical belt due to extreme desertification caused by low rainfall caused by greatly reduced evaporation of water from the oceans in the cooler global climate.

This process is reversed, but only briefly, in 10,000-year-long global warming periods, and the flourishing species in the Deep Tropics are able to repopulate the planet as the ice retreats and the rains return in a glorious Springtime on Earth. Sadly, the global warming phase has yet again come to an end, and mankind must again prepare to survive a fast approaching new ice age. The human species, thought to be 2 million years old, has survived many ice ages, albeit in very marginal numbers, and there is evidence that during the last ice age, oceanic migrations, in flotillas of large ships, using celestial navigation, allowed man to follow the warmer seasons and the food supply. So, it looks like mankind is much smarter than the dumb myth that “primitive” man was stuck in Africa throwing spears at animals.

Fortunately, mankind based around the Egyptian civilization, at the beginning of the present global warming period, was able to discover, with its pyramids serving as astronomic instruments, principles of the universe that led to the perfection of agriculture. Under an ever-expanding global food supply, mankind has been able to increase its population 1,000-fold, and tap ever-increasing densities of energy from wood, charcoal, coal, oil, gas, and now nuclear fission and soon fusion. Mankind is now in excellent technological shape to survive the coming ice age, and even increase its population.

Prince Philip’s Satanic Strategy

The only force that stands in the way is the British Empire. Its insane strategy—not for surviving an ice age but for hanging on to raw power—is to de-industrialize society back to the Middle Ages, and depopulate the world by 70% or more, by war, famine, and disease. This, in a nutshell, is the satanic strategy of Prince Philip and the late Lord Bertrand Russell for returning the world to the glory days of the 18th- and 19th-Cen-

tury British Empire, “upon which the Sun never set and the wages never rose.” The lunatics sincerely believe they are an elite, superior species with the born-to-rule right to treat the rest of mankind as herded animals. They hate mankind with a virulence that few outside the LaRouche movement understand. Their love for wildlife and the environment is also claptrap, and their ability to fool most of the population with their green ideology is fast coming to an end.

Wildlife technology recognizes that there is no such thing as an endangered species. Man’s urbanization and industrial development in no way threatens a single species. Any selected species of plant, animal, insect, or microorganism of the estimated 50 million species on Earth can be mass-produced by man, way beyond the natural “carrying capacity of the land,” provided its basic biological and reproductive needs are understood. Indeed, the last 10,000 years of agriculture is a tribute to the power of wildlife technology. Domestic animals such as chickens, sheep, and cattle were once wildlife that were near the top of the natural food chain and existed in low population levels. Now their numbers as managed food animals match the 1,000-fold increase that the human population has enjoyed.

Selected rare, wild plants, such as corn, wheat, and vegetables and fruits, have been artificially selected over many thousands of years to feed an exponentially increasing world human population. The mass production of selected fungi in deep culture vessels generated natural penicillin, and then, semi-synthetic antibiotics that controlled bacterial diseases for the first time in human history.

Likewise, any species found to be useful to man, now, or by future generations, can be mass produced. The 50 million living species are the creative product of the Biosphere over its 4-billion-year history. Every species is breakfast for other species, and to survive has had to develop a complex and integrated survival strategy to avoid being eaten, in an ever-evolving creative Biosphere. One day soon, students may be encouraged to each adopt a species, and spend a lifetime delving deeper and deeper into discovering how that species survives.

Man, as the only species that can think, gives us the power to discover and exploit the unique attribute that every species represents. This is why it is essential to protect every species created in the Biosphere, even the hazardous ones like mosquitoes and snakes. We would do well to re-create long-extinct species in earlier epochs of the Biosphere, and the more recent large car-

crease in world food production for a growing world population, as the Earth once again freezes over in another ice age.

The Nuclear Renaissance

The nuclear renaissance led by Russia, China, and India, and hopefully soon, America, can therefore help guarantee our food supply, even during the now rapidly approaching new 100,000-year ice age on Earth, as the 10,000-year natural global warming cycle reaches its end. This time 'round, the Biosphere will depend entirely on the creative abilities of mankind to not only protect all the 50 million species, but will also make the Earth blossom during an ice age.

Recall the wise words of the Russian Academician, the founding student of the Biosphere and the human Noösphere,

Vladimir Vernadsky, when opening the Radium Institute in St. Petersburg in 1922: "Soon mankind will have atomic power in his hands. This is a power source which will give him a possibility to build his life just as he wishes."

Sixty-five million years ago, a comet struck the Earth, creating the Gulf of Mexico, and throwing up a global dust cloud that blocked solar radiation for several years, halting photosynthesis. The grass-eating giant dinosaur species that had roamed and ruled the Earth for 160 million years suddenly had nothing to eat, and all were exterminated, making room for an entirely new range of weird and wonderful species that evolved with remarkable speed, once photosynthesis was restored.

Next in line for extinction, is the overpopulated British Empire, the last in line of a 3,000-year rule of Empires, based on the international control of money. In the collapsing world economy, Lyndon LaRouche has called the bluff of the British Empire. They are completely bankrupt. They have no money. They have nothing to eat, and with a bit of shoving and a lot of howls, will go the way of the once all-powerful dinosaurs.

Sixty-five million years ago, a comet struck the Earth, throwing up a global dust cloud that blocked solar radiation for several years, halting photosynthesis. The grass-eating giant dinosaur species that had roamed and ruled the Earth for 160 million years suddenly had nothing to eat, and all were exterminated.

Next in line for extinction, is the overpopulated British Empire.

nivores exterminated by man, which lacked the technologies to co-exist with such dangerous animals.

In the Malaysian humid tropics, certain species of African grass are now being mass-produced without weeds, insects, or plant diseases, on plantation scale, and harvested when three feet tall, every 35 days, for three years. This young cut grass provides highly nutritious cellulose before the lignification stage naturally protects the cellulose from being efficiently digested by insects and ruminant animals. Super-production occurs when the grass with protein and mineral supplements is fed to climate-housed improved breeds of cattle and sheep that enjoy near-human standards of housing and hygiene.

The new Deep Tropical agricultural breakthrough produces three times more milk and meat, per hectare of land, per year, than the best grazing farms in the world, such as those in New Zealand. With abundant supplies of nuclear desalinated water now back on the horizon in developing countries, after 40 years of sabotage, Deep Tropical grass plantations, cereal crops, and vegetable production can spread throughout the vast tropical landmass, even deserts, to provide a great in-
